

Upgrade functions

EXACTLY what you should do (step-by-step)

✓ Step 1 — Update Node runtime

Go to your **functions/package.json**

Find:

```
"engines": {  
  "node": "20"  
}
```

Change to:

```
"engines": {  
  "node": "22"  
}
```

✓ Step 2 — Upgrade Firebase packages

In your **functions folder**, run:

```
npm install firebase-functions@latest firebase-admin@latest
```

✓ Step 3 — Check your imports (VERY IMPORTANT)

Older code might look like:

```
const functions = require("firebase-functions");
```

Newer (recommended, v2 style):

```
const { onRequest } = require("firebase-functions/v2/https");
```

or

```
import { onRequest } from "firebase-functions/v2/https";
```

If you're using v1 functions (older style)

Example:

```
exports.myFunction = functions.https.onCall(...)
```

 You *can* keep this, but:

- v2 is recommended
- future-proofing = migrate gradually

Step 4 — Test locally BEFORE deploying

Run:

```
firebase emulators:start
```

Then test:

- analytics ingestion
- notification function
- match function

Step 5 — Deploy

```
firebase deploy--only functions
```

What could break (be aware)

Most common issues:

1. Import paths

- v1 vs v2 mismatch

2. Type errors (TypeScript stricter)

- new versions enforce stricter typing

3. Callable functions

- request/response format slightly different in v2

4. Region / config differences

- v2 uses:
-
